

Project: AI Psychologist

1. Problem Statement

Objective

You will build a **Full Stack AI Chat Application** called “**AI Psychologist**”.

The app will allow users to register, log in, and chat with an **AI-based psychologist** who provides empathetic, supportive responses.

This project will test your **frontend, backend, database, and AI integration** skills.

Time Allocation

3 days

Core Requirements

1. User Authentication

- Users can **Register** and **Login** using email and password.
- Implement authentication (preferably JWT-based).
- Redirect to the chat page after login.

2. Chat Interface

- Create a simple, clean chat UI (like WhatsApp or ChatGPT).
- Users can send messages and receive AI responses in real-time.
- Show typing indicators and separate user/AI messages visually.
- Save chat history in the database.

3. AI Integration

- Use **OpenAI GPT** or **Google Gemini** for conversation.
- Handle all API calls from the backend (never expose keys on the frontend).
- The AI should reply in a friendly, supportive, and conversational tone.
- Write a good system prompt

4. Database

Store user and message details in the database.

Each user should have their own chat history saved for future reference.

Tech Stack

Frontend	React or Angular
Backend	Python (FastAPI / Django) or TypeScript (Express / NestJS)
Database	MongoDB / PostgreSQL / MySQL
AI API	OpenAI GPT / Gemini 1.5 Pro

Finalize

- Test your application thoroughly.
- Clean up your code and add comments.
- Create a good README file that includes:
 - Project Overview
 - Tech Stack Used
 - Setup Instructions
 - How to run Backend & Frontend
 - Screenshots or short video link
- Create a GitHub repository for this project and upload your code there.
- Once complete, share the GitHub repository with the project to hrittik.garain@perceptechsolutions.com and put maaitrayo.das@perceptechsolutions.com in CC.
